Public Opinion Survey: Residents of Jordan

June 20-29, 2018
Detailed Methodology

• The survey was conducted on behalf of the Center for Insights in Survey Research by NAMA Strategic Intelligence Solutions.

• This survey is made possible by the generous support of the American people through the United States Agency for International Development.

• The sample consists of n=1,525 face-to-face interviews with Jordanians aged 18 and above conducted nationwide between June 20th and 29th 2018. The sample excludes Jordanians living in student housing, prisons, nursing homes, and factory accommodations.

• The 2015 National Census was used to design and draw the sample. The sample was designed to cover the 12 governorates, using a stratified cluster proportional to size sampling method with three levels:
  1) Governorates divided into rural and urban areas
  2) Administrative divisions within each urban and rural area
  3) Clusters within each administrative division. One hundred fifty-two census blocks served as the primary sampling units (PSU).

  Within each PSU, 10 households were selected through equal probability systematic selection based on a household listing exercise. The ‘next-birthday’ method was used to select the respondent. The response rate was 87 percent.

• The data was weighted to reflect the actual distribution of the population; the weight is based on the population size for each stratum and the block size (number of families) as main variables, as well as the number of respondents from each block and the total number of blocks.

• The margin of error is plus or minus 2.5 percent at the midrange of the 95 percent confidence level.

• Figures in charts and tables may not add up to 100 percent due to rounding.
